Today’s Topics

Computer Science 1
    Review

Upcoming
    Final Exam: Saturday, 12/13, 2:00pm, B101 LSRC
    Review Session: TBA

Reading
    Great Ideas, Chapter 4 - 15
4. Top-Down Programming, Subroutines, and a Database Application

- Functions using Functions
- Getting Information In and Out of Functions
- Class Data: known within class.
- Formal Parameters/Arguments
- Syntax: Using a Function
- Functions that Return Values
- Syntax: Defining a Function
- Larger Problems: How to Deal with the Complexity
  - Divide and Conquer
  - Design: Stepwise Refinement
  - Top-Down Implementation
4. Top-Down Programming, Subroutines, and a Database Application

- "Parallel" Arrays or "Corresponding" Arrays
  - Model Phone Book Capability
  - Typical Access by Name
  - Access by other Fields (other arrays)
- Extend Idea to Database
- Basic Data Base Functions
- Wild Card Retrieval
- Used Car Database
- Relational Data Bases
4. Top-Down Programming, Subroutines, and a Database Application

- Recursion
  - Factorial (N!)
  - Iterative Approach for Factorial
  - Exponentiation (X^N)
- Church-Markov-Turing Thesis
  - This part of Java lets you solve all kinds of algorithms
5. Graphics, Classes, and Objects

- **Basic Stuff**
  - Canvas class, Graphics class, pixels, Coordinates

- **Graphics Methods**
  - void drawLine(int x1, int y1, int x2, int y2)
  - void drawRect(int x, int y, int width, int height)
  - void drawOval(int x, int y, int width, int height)
  - void setColor(Color c)

- **Example: (Using Recursion) Serpinsky.java**
5. Graphics, Classes, and Objects

- Writing a Class
  - Header
  - Contents of a class definition
  - The Constructor
  - The \texttt{serp} Class to draw Serpinsky Gasket

- Simple-Minded Animation
  - Draw and Erase
6. Simulation

- Simulation: Motivation
- Optimization, Simulation: Biggest Dog Lot
- How Could We Automate Process?
- Other Roles For Simulations
  - Economy, Policy (e.g. birth control), Marketing
  - Camera Lenses, UNC CS Walkthrough, Virtual Reality
- Simulation in Microelectronics
  - Logic, Layout, Circuit, Process
- Design and Manufacturing
7. Software Engineering

- Engineering a Program - Programming in the Large
- What is Good Software?
- Program Life Cycle, Feedback Cycles
- Understanding Problem / Specifications
- Debugging
- Correctness, Proofs?
- Documentation
- Testing
- Bottom Line: Productivity: 15 LINES OF CODE/DAY
- Many People? The "Committee": Interaction
- Organizational Schemes: e.g. Chief Programmer Team
7. Software Engineering

- Killer Robot Scenario
  - Development Models
    - Waterfall
    - Prototyping
  - Testing
  - User Interface
- Ethics
8. Machine Architecture

- Architecture (definition)
- Hardware / Software
- Basic Computer very primitive
- Architectural Features
  - Memory
  - CPU: AX, IP, IR, CF
- Fetch/Execute Cycles
- Need to handle IF and WHILE situations
- Tracing (often the only way to understand)
- Loop Example: Factorial Example
- Handling Lists or Arrays (Self Modifying Code)
- Fancier Architecture
9. Language Translation

- Importance of language
- Goal: *Translate Java To Assembler*
- Revise Syntactic Production Rules (seen before)
- Use Rules to Modify Strings
- Add Semantic ("meaning") Components to our Rules
- Use Syntactic Derivation to Generate Semantic Rules;
  Use Semantic rules to Generate Code
- Rules for Looping
- Important: *Everything done by simple substitution*
- Everything "adds up"
Electric Circuits

- Levels of a Computer System
- Circuits: Water Model (the real thing = electrons)
  - battery, generators, heat -> light, motors
- Circuits With Switches (e.g. knife switch)
- Logic/Truth Tables: AND, OR
- Implementing Logic with Switches
- Logical (Boolean) Expression
- Equivalence of:
  - Circuit with Switches, Truth Tables, Boolean Expression
- Arbitrary Truth table for f(x,y,z)
Electric Circuits

- Relays
- Storing Information (Memory): Latch
- Binary Numbers
  - Conversion to and from Decimal
- Binary Addition
  - Truth Tables
  - Block Diagram
  - Simple Adder Circuit
  - Decoding/Control
12. Computer Communications

- Computer Communications is one of the Great Ideas
- Modes of Communications
- Like Most of Computing: Layers upon Layers
- Basic Communications: In binary
- Connection Mode
  - Circuit Switched, Message Switched, Packet Switched

TCP/IP

- Ethernet (Bus Example)
- Internet -- a network of LANs that are interconnected
- Packets -- the currency of the Internet
- The Layers
  - The Physical Layer, The IP (Internet Protocol) Layer
  - The TCP Layer, The Application Layer
12. Computer Communications

- Packets Within Packets (Encapsulation)
- Reliability
- Addressing (Layers Again!)
  - Hardware Address (Ethernet Address)
  - IP Address
  - Domain Name (address)
- Applications
  - email, news, talk, ftp, telnet, ssh, rlogin
  - information services: WWW, Older: gopher, WAIS
- Client/Server
  - Print Server, File Server, Name Server,
  - WWW
11. Security, Privacy and Wishful Thinking

- Billions in Losses
- Possible Traps in Public Systems
  - Trojan Horse, Onlooker, Digital camera
- Good Passwords and Cracking
  - Briefcase combination lock
  - Analysis of brute force methods
  - Password on a Computer
  - Dictionary Attacks
- Encryption
  - Monoalphabetic Substitution
  - Polyalphabetic Substitution
  - The Vignere Cypher; The Babbit Solution
11. Security, Privacy and Wishful Thinking

- Cypher Reuse: BAD
- One Time Pads: Can be Absolutely Secure
- The Key Exchange Problem
  - Using your "secure" channel (bad)
  - A Padlock Analogy
- Public Key Encryption
  - A Padlock Analogy
  - Rivest, Shamir, and Adleman (RSA) Encryption
    - Using Public Key and Private Key
    - Primes and Factoring
  - Breaking the Code: *Factoring*
11. Security, Privacy and Wishful Thinking

- Public Key Encryption
  - Digital Signatures
    - Using Private Key and Public Key
    - Need for Time Stamps
- Other Attacks (Buzz Words)
  - Many Leave No Trace
  - Password Hacking, IP Spoofing, Replay Attack
  - Man in the Middle, Denial of Service
- Whom Can You Trust?
  - Viruses, Trapdoors, Trojan Horses, Common Sense
- The Strong Encryption Trap
10. Virtual Environments for Computing

- The Raw Machine Provides a Hostile Environment
- Early Years Had Major Theme: CPU Time Precious
- Later Years: Cheaper and Cheaper Hardware
- What Does an Operating System Do?
  - Processor Management (Multiprogramming)
  - I/O Systems
  - Memory Management
  - Software Environments
- Memory Management
  - Memory Hierarchies, Paging, Protection
10. Virtual Environments for Computing

- I/O Systems
  - Files Systems, Communications/Networking
  - Graphical User Interfaces (GUI)

- Processor Management
  - True Parallel Processes vs Simulated
  - Synchronization
    - Race condition
    - Deadlock
Changing Computer Technology

- Some Fundamental Limitations
  - Speed of light, heat dissipations, capacitance and inductance
- Other Important Concerns
  - Economics !!!, Noise, Lifetime (mtf), Space
- Relay Computers (and problems)
- Vacuum Tube Computers (and problems)
- Transistor
- Integrated Circuits -- VLSI
- Economics of Silicon (Micro-electronics): CPUs in Everything
- Technology Summary (table)
13. Program Execution Time

- On the Limitations of Computer Science
  - 1. too slow. 2. Non-computable. 3. Don't know algorithm
- Time Complexity, N
- Study of a Sorting Algorithm: Selection Sort: $N^2$
- Polynomial = Tractable
  - Linear Time Algorithms: $t = A \times N$
  - Cubic Time Algorithms: $t = A \times N^3$
  - Quicksort: $t = A \times N \times \log(N)$
  - Binary Search: $t = A \times \log(N)$
- Intractable Algorithms: Exponential $t = A \times B^N$
  - Chess, Traveling Salesperson, Towers of Hanoi
- More hardware not always the answer!
14. Parallel Computation

- Limitation on Processor Speed
  - Speed of Light
  - Manufacturing Problems with Small Sizes
  - Heat Dissipation
- Ultimately Parallelism is Only Hope
- Forms of Parallelism
  - Word Size, Pipe Line (Laundry Example)
  - Multiprocessors, Networks of Processors, Internet
- Speedup
- What can we do with 100 processors?
  - Even with optimal speedup no big help for $B^N$ programs
15. Noncomputability

- Certain Problems Not Amenable to Computer Solution
- Existence of Noncomputable Functions
  - Approach: *Matching up Programs and Functions*
  - Have: Uncountable Infinity of Functions (cannot be put into a row)
  - All Programs Can be Ordered
  - Try to Draw Lines Between Functions and Programs
  - Many more Functions than Programs!
- Programs that Read Programs
  - E.g., Java Compiler
- Solving the *Halting Problem*
15. Noncomputability

- Proofs by Contradiction (Indirect Proof)
- Proving non-computability
  - Assume Existence of Function \( \text{halt} \):
  - Use in way resulting in Paradox!
  - Therefore \( \text{halt} \) cannot exist!
- What Does It All Mean?
