What is a Binary Search?

- Magic!
  - Has been used a the basis for “magical” tricks
- Find telephone number (without computer) in seconds
  - If that isn’t magic, what is?
- There are less than $10^{80}$ atoms in the universe.
  - If ordered, how long to locate a particular one?
- Demo!
- What is the big-Oh?

Analysis: Algorithms and Data Structures

- We need a vocabulary to discuss performance and to reason about alternative algorithms and implementations
  - It’s faster! It’s more elegant! It’s safer! It’s cooler!
- We need empirical tests and analytical/mathematical tools
  - Given two methods, which is better? Run them to check.
    - 30 seconds vs. 3 seconds, easy. 5 hours vs. 2 minutes, harder
    - What if it takes two weeks to implement the methods?
  - Use mathematics to analyze the algorithm,
  - The implementation is another matter, cache, compiler optimizations, OS, memory,…

Recursion and recurrences

- Why are some functions written recursively?
  - Simpler to understand, but …
  - Mt. Everest reasons
- Are there reasons to prefer iteration?
  - Better optimizer: programmer/scientist v. compiler
  - Six of one? Or serious differences
    - “One person’s meat is another person’s poison”
    - “To each his own”, “Chacun a son gout”, …
- Complexity (big-Oh) for iterative and recursive functions
  - How to determine, estimate, intuit

What’s the complexity of this code?

```java
// first and last are integer indexes, list is List
int lastIndex = first;
Object pivot = list.get(first);
for(int k=first+1; k <= last; k++)
    Comparable ko = (Comparable) list.get(k);
    if (ko.compareTo(pivot) <= 0){
        lastIndex++; Collections.swap(list,lastIndex,k);
    }
```

- What is big-Oh cost of a loop that visits $n$ elements of a vector?
  - Depends on loop body, if body $O(1)$ then …
  - If body is $O(n)$ then …
  - If body is $O(k)$ for $k$ in $[0..n)$ then …
**FastFinder.findHelper**

```java
private Object findHelper(ArrayList list, int first, int last, int kindex){
    int lastIndex = first;
    Object pivot = list.get(first);
    for(int k=first+1; k <= last; k++){
        Comparable ko = (Comparable) list.get(k);
        if (ko.compareTo(pivot) <= 0){
            lastIndex++;
            Collections.swap(list, lastIndex, k);
        }
    }
    Collections.swap(list, lastIndex, first);
    if (lastIndex == kindex) return list.get(lastIndex);
    if (kindex < lastIndex)
        return findHelper(list, first, lastIndex-1, kindex);
    return findHelper(list, lastIndex+1, last, kindex);
}
```

**Different measures of complexity**

- **Worst case**
  - Gives a good upper-bound on behavior
  - Never get worse than this
  - Drawbacks?

- **Average case**
  - What does average mean?
  - Averaged over all inputs? Assuming uniformly distributed random data?
  - Drawbacks?

- **Best case**
  - Linear search, useful?

**Multiplying and adding big-Oh**

- Suppose we do a linear search then we do another one
  - What is the complexity?
  - If we do 100 linear searches?
  - If we do n searches on a vector of size n?

- What if we do binary search followed by linear search?
  - What are big-Oh complexities? Sum?
  - About 50 binary searches? What about n searches?

- What is the number of elements in the list (1,2,2,3,3,3)?
  - What about (1,2,2,..., n,n,...,n)?
  - How can we reason about this?

**Helpful formulae**

- We always mean base 2 unless otherwise stated
  - What is log(1024)?
  - $\log(xy) = \log(x) + \log(y)$
  - $\log(2^n) = n$
  - $2^{(\log n)} = n$

- Sums (also, use sigma notation when possible)
  - $\sum_{i=0}^{k} 2^i = 2^{k+1} - 1$
  - $\sum_{i=1}^{n} i(n+1)/2 = \frac{n(n+1)}{2}$
  - $a + ar + ar^2 + ... + ar^{n-1} = a(r^n - 1)/(r-1)$
Recursion Review

- Recursive functions have two key attributes
  - There is a base case, sometimes called the exit case, which does not make a recursive call
  - All other cases make recursive call(s), the results of these calls are used to return a value when necessary
    - Ensure that every sequence of calls reaches base case
    - Some measure decreases/moves towards base case
    - “Measure” can be tricky, but usually it’s straightforward

- Example: sequential search in an ArrayList
  - If first element is search key, done and return
  - Otherwise look in the “rest of the list”
  - How can we recur on “rest of list”?

Sequential search revisited

- What is complexity of sequential search? Of code below?

```java
boolean search(ArrayList list, int first, Object target) {
    if (first >= list.size()) return false;
    else if (list.get(first).equals(target))
        return true;
    else return search(list, first+1, target);
}
```

- Why are there three parameters? Same name good idea?

```java
boolean search(ArrayList list, Object target){
    return search(list, 0, target);
}
```

Why we study recurrences/complexity?

- Tools to analyze algorithms
- Machine-independent measuring methods
- Familiarity with good data structures/algorithms

- What is CS person: programmer, scientist, engineer? *scientists build to learn, engineers learn to build*

- Mathematics is a notation that helps in thinking, discussion, programming

Recurrences

- Summing Numbers

```java
int sum(int n) {
    if (0 == n) return 0;
    else return n + sum(n-1);
}
```

- What is complexity? justification?
- T(n) = time to compute sum for n
  - T(n) = T(n-1) + 1
  - T(0) = 1

  - instead of 1, use O(1) for constant time
  - independent of n, the measure of problem size
Solving recurrence relations

- **plug, simplify, reduce, guess, verify?**

  \[
  T(n) = T(n-1) + 1 \\
  T(0) = 1 \\
  T(n-1) = T(n-1-1) + 1 \\
  T(n) = [T(n-2) + 1] + 1 = T(n-2)+2 \\
  T(n-2) = T(n-2-1) + 1 \\
  T(n) = [(T(n-3) + 1) + 1] + 1 = T(n-3)+3 \\
  T(n) = T(n-k) + k \\
  \]

  **find the pattern!**

  Now, let \( k=n \), then \( T(n) = T(0)+n = 1+n \)

- **get to base case, solve the recurrence: \( O(n) \)**

Complexity Practice

- **What is complexity of Build? (what does it do?)**

  ```java
  ArrayList build(int n)
  {
      if (0 == n) return new ArrayList(); // empty
      ArrayList list = build(n-1);
      for(int k=0;k < n; k++)
      {
          list.add(new Integer(n));
      }
      return list;
  }
  ```

- **Write an expression for \( T(n) \) and for \( T(0) \), solve.**

Recognizing Recurrences

- **Solve once, re-use in new contexts**

  - **T** must be explicitly identified
  - **n** must be some measure of size of input/parameter
    - \( T(n) \) is the time for quicksort to run on an \( n \)-element vector

  \[
  T(n) = T(n/2) + O(1) \quad \text{binary search} \quad O( \log n ) \\
  T(n) = T(n-1) + O(1) \quad \text{sequential search} \quad O( n ) \\
  T(n) = 2T(n/2) + O(1) \quad \text{tree traversal} \quad O( n ) \\
  T(n) = 2T(n/2) + O(n) \quad \text{quicksort} \quad O(n \log n) \\
  T(n) = T(n-1) + O(n) \quad \text{selection sort} \quad O( n^2 )
  \]

- **Remember the algorithm, re-derive complexity**
