

## XML, DTD, and XML Schema

CPS 116

Introduction to Database Systems

---

---

---

---

---

---

## Announcements (Thu. Sep. 24)<sup>2</sup>

- ❖ Homework #2 due Tuesday
  - Dongtao will run a help session next Monday 4-5pm
- ❖ Midterm next Thursday in class
  - Open book, open notes
  - Sample midterm (from last year) handed out on Tuesday
    - Sample solution available today
- ❖ Project milestone #1 due in 2 weeks
  - Guest lecture by Prof. Cohen next Tuesday

---

---

---

---

---

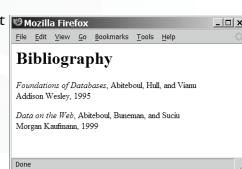

---

## From HTML to XML (eXtensible Markup Language)<sup>3</sup>

- ❖ HTML describes presentation of content

```
<h1>Bibliography</h1>
<p><i>Foundations of Databases</i>
Abiteboul, Hull, and Vianu
<br>Addison Wesley, 1995
<p>--
```
- ❖ XML describes only the content

```
<bibliography>
<book>
<title>Foundations of Databases</title>
<author>Abiteboul</author>
<author>Hull</author>
<author>Vianu</author>
<publisher>Addison Wesley</publisher>
<year>1995</year>
</book>
<book>--</book>
</bibliography>
```
- ❖ Separation of content from presentation simplifies content extraction and allows the same content to be presented easily in different looks

---

---

---

---

---

---

## Other nice features of XML

- ❖ Portability: Just like HTML, you can ship XML data across platforms
  - Relational data requires heavy-weight protocols, e.g., JDBC
- ❖ Flexibility: You can represent any information (structured, semi-structured, documents, ...)
  - Relational data is best suited for structured data
- ❖ Extensibility: Since data describes itself, you can change the schema easily
  - Relational schema is rigid and difficult to change

## XML terminology

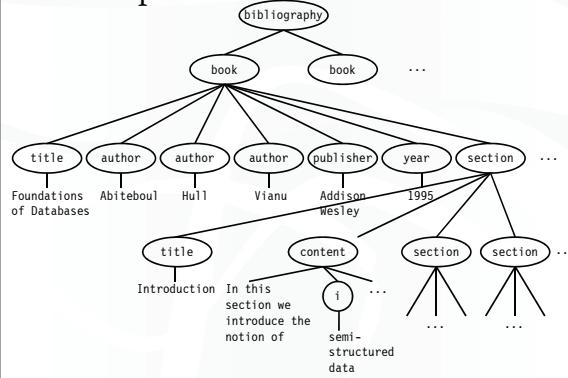

- ❖ Tag names: book, title, ...
- ❖ Start tags: <book>, <title>, ...
- ❖ End tags: </book>, </title>, ...
- ❖ An element is enclosed by a pair of start and end tags: <book>...</book>
  - Elements can be nested: <book>...<title>...</title>...</book>
  - Empty elements: <is\_textbook></is\_textbook>
    - Can be abbreviated: <is\_textbook/>
- ❖ Elements can also have attributes: <book ISBN="..." price="80.00">
- ❖ Ordering generally matters, except for attributes

## Well-formed XML documents

A well-formed XML document

- ❖ Follows XML lexical conventions
  - Wrong: <section>We show that x < 0.</section>
  - Right: <section>We show that x &lt; 0...</section>
    - Other special entities: > becomes &gt;; and & becomes &amp;;
- ❖ Contains a single root element
- ❖ Has properly matched tags and properly nested elements
  - Right:  
<section>...<subsection>...</subsection>...</section>
  - Wrong:  
<section>...<subsection>...</section>...</subsection>

## A tree representation

## More XML features

- ❖ Comments: <!-- Comments here -->
- ❖ CDATA section: <![CDATA[Tags: <book>, ...]]>
- ❖ ID's and references
  - <person id="012"><name>Homer</name>...</person>
  - <person id="034"><name>Marge</name>...</person>
  - <person id="056" father="#012" mother="#034"><name>Bart</name>...</person>
- ❖ Namespaces allow external schemas and qualified names
  - <book xmlns:myCitationStyle="http://.../mySchema">
  - <myCitationStyle:title>...</myCitationStyle:title>
  - <myCitationStyle:author>...</myCitationStyle:author>...
- ❖ Processing instructions for apps: <? ...java applet... ?>
- ❖ And more...

## Valid XML documents

- ❖ A valid XML document conforms to a Document Type Definition (DTD)
  - A DTD is optional
  - A DTD specifies a grammar for the document
    - Constraints on structures and values of elements, attributes, etc.
- ❖ Example

```
<!DOCTYPE bibliography [>
  <!ELEMENT bibliography (book+)>
  <!ELEMENT book (title, author*, publisher?, year?, section*)>
  <!ATTLIST book ISBN CDATA #REQUIRED>
  <!ATTLIST book price CDATA #IMPLIED>
  <!ELEMENT title (#PCDATA)>
  <!ELEMENT author (#PCDATA)>
  <!ELEMENT publisher (#PCDATA)>
  <!ELEMENT year (#PCDATA)>
  <!ELEMENT i (#PCDATA)>
  <!ELEMENT content (#PCDATA|i)*>
  <!ELEMENT section (title, content?, section*)>
]>
```

## DTD explained

10

```
<!DOCTYPE bibliography [
    <!-- bibliography is the root element of the document -->
    <!ELEMENT bibliography (book+)>           One or more
    <!-- bibliography consists of a sequence of one or more book elements -->
    <!ELEMENT book (title, author*, publisher?, year?, section*)>
        <!-- Zero or one -->
        <!-- Zero or more -->
    <!-- book consists of a title, zero or more authors,
        an optional publisher, and zero or more sections, in sequence -->
<!ATTLIST book ISBN ID #REQUIRED>
    <!-- book has a required ISBN attribute which is a unique identifier -->
<!ATTLIST book price CDATA #IMPLIED>      <!--><book ISBN="ISBN-10: 0-201-59959-3" price="80.00">
    <!-- book has an optional #IMPLIED -->          <title>XML and Databases</title>
    <!-- price attribute which contains -->          <author>Hull</author>
    <!-- character data -->                         <author>Vianu</author>
                                                <!--><publisher>Addison Wesley</publisher>
                                                <!--><year>1995</year>
                                                <!--></book>
                                                <!--></bibliography>
Other attribute types include IDREF (reference to an ID), IDREFS (space-separated list of references), enumerated list, etc.
```

## DTD explained (cont'd)

11

```
<!ELEMENT title (#PCDATA)>
<!ELEMENT author (#PCDATA)>
<!ELEMENT publisher (#PCDATA)>  PCDATA is text that will be parsed
<!ELEMENT year (#PCDATA)>       • &lt;; etc. will be parsed as entities
<!ELEMENT i (#PCDATA)>         • Use a CDATA section to include text verbatim
    <!-- author, publisher, year, and i contain parsed character data -->
<!ELEMENT content (#PCDATA|i)*>
    <!-- content contains mixed content: text optionally interspersed with i elements -->
<!ELEMENT section (title, content?, section*)>
    <!-- Recursive declaration: -->
    <!-- Each section begins with a title, -->
    <!-- followed by an optional content, and -->
    <!-- then zero or more (sub) sections -->
]>
```

## Using DTD

12

### ❖ DTD can be included in the XML source file

- <?xml version="1.0"?>
- <!DOCTYPE bibliography [
- <!-- -->
- ]>
- <bibliography>
- <!-- -->
- </bibliography>

### ❖ DTD can be external

- <?xml version="1.0"?>
- <!DOCTYPE bibliography SYSTEM "../dtds/bib.dtd">
- <bibliography>
- <!-- -->
- </bibliography>
- <?xml version="1.0"?>
- <!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Strict//EN"
 "http://www.w3.org/TR/xhtml1/DTD/xhtml1-strict.dtd">
- <html>
- <!-- -->
- </html>

## Annoyances: element type declarations

13

- ❖ Consider this element content (children) declaration:  

```
<!ELEMENT pub-venue
  ( (name, address, month, year) |
    (name, volume, number, year) )>
```

  - “|” means “or”
- ❖ Syntactically legal, but won’t work
  - Because of SGML compatibility issues
  - When looking at **name**, a parser would not know which way to go without looking further ahead
  - Requirement: content declaration must be “deterministic”  
(i.e., no look-ahead required)
  - Can we rewrite it into an equivalent, deterministic one?
- ❖ Also, you cannot nest mixed content declarations
  - Illegal: <!ELEMENT Section (title, (#PCDATA|i)\*, section\*)>

---

---

---

---

---

---

---

## Annoyances: element name clash

14

- ❖ Suppose we want to represent book titles and section titles differently
  - Book titles are pure text: (#PCDATA)
  - Section titles can have formatting tags:  
(#PCDATA|i|b|math)\*
- ❖ But DTD only allows one **title** declaration!
- ❖ Workaround: rename as **book-title** and **section-title**?
  - Not nice—why can’t one infer title’s contexts from data?

---

---

---

---

---

---

---

## Annoyances: lack of type support

15

- ❖ Too few attribute types: string (CDATA), token (e.g., ID, IDREF), enumeration (e.g., (red|green|blue))
  - What about integer, float, date, etc.?
- ❖ ID not typed
  - No two elements can have the same ID value, even if they are different types of elements (e.g., **book** vs. **section**)
- ❖ Difficult to reuse complex structure definitions
  - E.g.: already defined element E1 as (blah, bleh, foo?, bar\*, ...); want to define E2 to have the same structure
    - Parameter entities in DTD provide a workaround
      - <!ENTITY % E.struct '(blah, bleh, foo?, bar\*, ...)’>
      - <!ELEMENT E1 %E.struct; >
      - <!ELEMENT E2 %E.struct; >
    - Something less “hacky”?

---

---

---

---

---

---

---

XML Schema

16

- ❖ A more powerful way of defining the structure and constraining the contents of XML documents
  - ❖ An XML Schema definition is itself an XML document
    - Typically stored as a standalone .xsd file
    - XML (data) documents refer to external .xsd files
  - ❖ W3C recommendation
    - Unlike DTD, XML Schema is separate from the XML specification

## XML Schema definition (XSD)

17

## XSD example

18

```

<xs:element name="book">
  <xs:complexType> Declares a structure with child elements/attributes as opposed to just text)
    <xs:sequence> Declares a sequence of child elements, like "( , , , )"
      <xs:element name="title" type="xs:string"/> A leaf element with string content
      <xs:element name="author" type="xs:string"
        minOccurs="0" maxOccurs="unbounded"/> Like author* in DTD
      <xs:element name="publisher" type="xs:string"
        minOccurs="0" maxOccurs="1"/> Like publisher? in DTD
      <xs:element name="year" type="xs:integer" minOccurs="0" maxOccurs="1"/>
      <xs:element ref="section" minOccurs="0" maxOccurs="unbounded"/>
    </xs:sequence>
    <xs:attribute name="ISBN" type="xs:string" use="required">
      Declares an attribute under book... and this attribute is required
    <xs:attribute name="price" type="xs:decimal" use="optional"/>
  </xs:complexType> This attribute has a decimal value, and it is optional
</xs:element>

```

## XSD example cont'd

19

```
<xss:element name="section">
  <xss:complexType>
    <xss:sequence>
      <xss:element name="title" type="xs:string"/> Another title definition; can be different
      <xss:element name="content" minOccurs="0" maxOccurs="1">
        <xss:complexType mixed="true"> Declares mixed content
          <xss:choice minOccurs="0" maxOccurs="unbounded"> min/maxOccurs can be
            A compositor like <xss:choice minOccurs="0" maxOccurs="unbounded"> attached to compositors too
            xs:sequence; this one declares a list of alternatives.
            like "...|...|..." in DTD. <xss:element name="i" type="xs:string"/>
            <xss:element name="b" type="xs:string"/>
          </xss:choice>
        </xss:complexType> Like (#PCDATA|i|b)* in DTD
      </xss:element>
    <xss:element ref="section" minOccurs="0" maxOccurs="unbounded"/>
  <xss:sequence> Recursive definition
</xss:complexType>
</xss:element>
```

## XSD example cont'd

20

### To complete bib.xsd:

```
<xss:element name="bibliography">
  <xss:complexType>
    <xss:sequence>
      <xss:element ref="book" minOccurs="0" maxOccurs="unbounded"/>
    </xss:sequence>
  </xss:complexType>
</xss:element>
```

### To use bib.xsd in an XML document:

```
<?xml version="1.0"?>
<bibliography xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
               xsi:noNamespaceSchemaLocation="file:bib.xsd">
  <book>... </book>
  <book>... </book>
  ...
</bibliography>
```

## Named types

21

### Define once:

```
<xss:complexType name="formattedTextType" mixed="true">
  <xss:choice minOccurs="0" maxOccurs="unbounded">
    <xss:element name="i" type="xs:string"/>
    <xss:element name="b" type="xs:string"/>
  </xss:choice>
</xss:complexType>
```

### Use elsewhere in XSD:

```
...
<xss:element name="title" type="formattedTextType"/>
<xss:element name="content" type="formattedTextType"
              minOccurs="0" maxOccurs="1"/>
...
...
```

## Restrictions

```
22
<xs:simpleType name="priceType">
  <xs:restriction base="xs:decimal">
    <xs:minInclusive value="0.00"/>
  </xs:restriction>
</xs:simpleType>

<xs:simpleType name="statusType">
  <xs:restriction base="xs:string">
    <xs:enumeration value="in stock"/>
    <xs:enumeration value="out of stock"/>
    <xs:enumeration value="out of print"/>
  </xs:restriction>
</xs:simpleType>
```

## Keys

```
23
<xs:element name="bibliography">
  <xs:complexType>... ...</xs:complexType>
  <xs:key name="bookKey">
    <xs:selector xpath=".//book"/>
    <xs:field xpath="@ISBN"/>
  </xs:key>
</xs:element>
```

- ❖ Under any **bibliography** element, elements reachable by selector “`./book`” (i.e., book child elements) must have unique values for field “`@ISBN`” (i.e., ISBN attributes)
  - In general, a key can consist of multiple fields (multiple `<xs:field>` elements under `<xs:key>`)
  - More on XPath in next lecture

## Foreign keys

- ❖ Suppose content can reference books

```

<xs:element name="content">
  <xs:complexType mixed="true">
    <xs:choice minOccurs="0" maxOccurs="unbounded">
      <xs:element name="i" type="xs:string"/>
      <xs:element name="b" type="xs:string"/>
      <xs:element name="book-ref">
        <xs:complexType><xs:attribute name="ISBN" type="xs:string"/></xs:complexType>
      </xs:element>
    </xs:choice>
  </xs:complexType>
  <xs:keyref name="bookForeignKey" refer="bookKey">
    <xs:selector xpath=".//book-ref"/>
    <xs:field xpath="@ISBN"/>
  </xs:keyref>
</xs:element>
```
- ❖ Under any **content** element, for elements reachable by selector “`./book-ref`” (i.e., book-ref child elements), values for field “`@ISBN`” (i.e., ISBN attributes) must appear as values of `bookKey`, the key being referred

## Why use DTD or XML Schema?

25

- ❖ Benefits of not using them
  - Unstructured data is easy to represent
  - Overhead of validation is avoided
- ❖ Benefits of using them
  - Serve as schema for the XML data
    - Guards against errors
    - Helps with processing

---

---

---

---

---

---

---

## XML versus relational data

26

- |                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Relational data                                                                                                                                                                                                                                                                                            | XML data                                                                                                                                                                                                                                                                                                                                                   |
| <ul style="list-style-type: none"><li>❖ Schema is always fixed in advance and difficult to change</li><li>❖ Simple, flat table structures</li><li>❖ Ordering of rows and columns is unimportant</li><li>❖ Data exchange is problematic</li><li>❖ “Native” support in all serious commercial DBMS</li></ul> | <ul style="list-style-type: none"><li>❖ Well-formed XML does not require predefined, fixed schema</li><li>❖ Nested structure; ID/IDREF(\$) permit arbitrary graphs</li><li>❖ Ordering forced by document format; may or may not be important</li><li>❖ Designed for easy exchange</li><li>❖ Often implemented as an “add-on” on top of relations</li></ul> |

---

---

---

---

---

---

---

## Case study

27

- ❖ Design an XML document representing cities, counties, and states
  - For states, record name and capital (city)
  - For counties, record name, area, and location (state)
  - For cities, record name, population, and location (county and state)
- ❖ Assume the following:
  - Names of states are unique
  - Names of counties are only unique within a state
  - Names of cities are only unique within a county
  - A city is always located in a single county
  - A county is always located in a single state

---

---

---

---

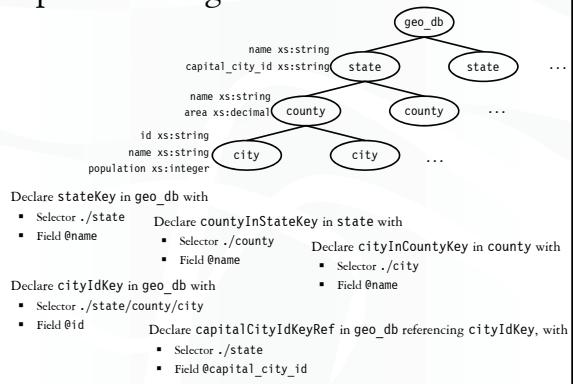

---

---

---

## A possible design

28

---

---

---

---

---

---

---

---
