Introduction
Introduction to Databases
CompSci 316 Fall 2015

About us: instructor and TA
• Instructor: Jun Yang
  • Been doing (and enjoying) research in databases ever since grad school (1995)
  • Didn’t take any database as an undergrad
  • Now working on data-intensive systems and computational journalism
• Graduate TA: Zilong Tan
  • PhD student in Computer Science
  • Working on data-intensive systems and cloud platforms

About us: UTAs
Charles  Cody  Stephen  Yubo
All CompSci 316 veterans!
What comes to your mind…

... when you think about “databases”?

But these use databases too...

Facebook uses MySQL to store posts, for example

WordPress uses MySQL to manage components of a website (pages, links, menus, etc.)

And these...

In a data-driven N.F.L., the pings (12 per sec. per player) may soon outstrip the X’s and O’s

... P.S. To Ashley Madison’s Development Team: You should be embarrassed [sic] for your train wrecks of a database (and obviously security), not sanitizing your phone numbers to your database is completely amateur, it’s as if the entire site was made by Comp Sci 1XX students.

— Creators of CheckAshleyMadison.com

And this...

http://www.open-data.org/2015/06/15/how-open-map-data-is-helping-save-lives-in-nepal/

Challenges

• Moore’s Law:  
  Processing power doubles every 18 months  
• But amount of data doubles every 9 months  
  • Disk sales (# of bits) doubles every 9 months  
• Parkinson’s Law:  
  Data expands to fill the space available for storage

Moore’s Law reversed

Time to process all data _____ every 18 months!

• Does your attention span _____ every 18 months?  
  • No, so we need smarter data management techniques
Democratizing data (and analysis)

• And it’s not just about money and science
• Democratization of data: more data—relevant to you and the society—are being collected
  • “Smart planet”: sensors for phones and cars, roads and bridges, buildings and forests, ...
  • “Government in the sunshine”: spending reports, school performance, crime reports, corporate filings, campaign contributions, ...
• But few people know how to analyze them
• You will learn how to help bridge this divide

Misc. course info

• Website: http://sites.duke.edu/compsci316_01_f2015/
  • Course info; tentative schedule and reference sections in the book; lecture slides, assignments, help docs,...
• Programming: VM required; $50 worth of credits for VMs in the cloud, courtesy of Amazon
• Q&A on Piazza; grades, sample solutions on Sakai
• Watch your email for announcements
• Office hours to be posted

Grading

[90%, 100%] A / A / A+
[80%, 90%) B / B / B+
[70%, 80%) C / C / C+
[60%, 70%) D
[0%, 60%) F

• No “curves”
• Scale may be adjusted downwards (i.e., grades upwards) if, for example, an exam is too difficult
• Scale will not go upwards—mistake would be mine alone if I made an exam too easy
Duke Community Standard

• See course website for link
• Group discussion for assignments is okay (and encouraged), but
  • Acknowledge any help you receive from others
  • Make sure you “own” your solution
• All suspected cases of violation will be aggressively pursued

Course load

• Four homework assignments (35%)
  • Gradiance: immediately and automatically graded
  • Plus written and programming problems
• Course project (25%)
  • Details to be given in the third week of class
• Midterm and final (20% each)
  • Open book, open notes
  • No communication/Internet whatsoever
  • Final is comprehensive, but emphasizes the second half of the course

Projects from last year

• SMSmart (★★★★☆ on Google play)
  • Alan Ni, Jay Wang, Ben Schwab (UTA)
  • Search, Tweet, Yelp, etc. without a data connection—so long as you have texting on your phone
• FarmShots
  • Ouwen Huang, Arun Karottu, Yu Zhou Lee, Billy Wan
  • Helps you manage farms with analysis of satellite images
• Food Points Master
  • Howard Chung, Wenjun Mao, William Sheburne
  • Automatically tracks your DukeCard balance, and offers budgeting tools and spending analysis to help you manage your food points
Projects from earlier years

- **Expose.js**: natural language querying
  - E.g.: “find beers served by bar with name Satisfaction”
  - Ben Schwaab, James Hong, Jesse Hu, 2013
- **Pickup Coordinator**: an iPhone app that lets you coordinate carpool/pickups with others
  - Adam Cue, Kevin Esoda, Kate Yang, 2012
- **Mobile Pay**: quick way to make a transaction between two people on their phones
  - Michael Deng, Kevin Gao, Derek Zhou, 2012
- **FriendsTracker app**: where are my friends?
  - Anthony Lin, Jimmy Mu, Austin Benesh, Nic Dinkins, 2011

More past examples

- **ePrint iPhone app**
  - Ben Getson and Lucas Best, 2009
- **Making iTunes social**
  - Nick Patrick, 2006; Peter Williams and Nikhil Anur, 2009
- **Duke Schedulator**: ditch ACES—plan visually!
  - Alex Beutel, 2008
- **SensorDB**: manage/analyze sensor data from forest
- **Facebook**
  - Tyler Brock and Beth Trushkowsky, 2005
- **Web-based Kville tenting management**
  - Zach Marshall, 2005

Your turn to be creative

![Image of a baby]
So, what is a database system?

From Oxford Dictionary:
• **Database**: an organized body of related information
• **Database system, Database Management System (DBMS)**: a software system that facilitates the creation and maintenance and use of an electronic database

What do you want from a DBMS?

• Keep data around (persistent)
• Answer questions (queries) about data
• Update data

• Example: a traditional banking application
  • **Data**: Each account belongs to a branch, has a number, an owner, a balance, …; each branch has a location, a manager, …
  • **Persistency**: Balance can’t disappear after a power outage
  • **Query**: What’s the balance in Homer Simpson’s account? What’s the difference in average balance between Springfield and Capitol City accounts?
  • **Modification**: Homer withdraws $100; charge accounts with lower than $500 balance a $5 fee

Sounds simple!

• Text files
• Accounts/branches separated by newlines
• Fields separated by #’s
Query by programming

- What's the balance in Homer Simpson's account?
- A simple script
  - Scan through the accounts file
  - Look for the line containing "Homer Simpson"
  - Print out the balance

Query processing tricks

- Tens of thousands of accounts are not Homer's

And the list goes on...

What happens when the query changes to: What's the balance in account 00142-00857?

Observations

- There are many techniques—not only in storage and query processing, but also in concurrency control, recovery, etc.
- These techniques get used over and over again in different applications
- Different techniques may work better in different usage scenarios
The birth of DBMS – 1

From Hans J. Schek’s VLDB 2000 slides

The birth of DBMS – 2

From Hans J. Schek’s VLDB 2000 slides

The birth of DBMS – 3

From Hans J. Schek’s VLDB 2000 slides
Early efforts

- “Factoring out” data management functionalities from applications and standardizing these functionalities is an important first step
  - CODASYL standard (circa 1960’s)
  - Bachman got a Turing award for this in 1973

- But getting the abstraction right (the API between applications and the DBMS) is still tricky

CODASYL

- Query: Who have accounts with 0 balance managed by a branch in Springfield?
- Pseudo-code of a CODASYL application:
  
  Use index on account(balance) to get accounts with 0 balance;
  For each account record:
  Get the branch id of this account;
  Use index on branch(id) to get the branch record;
  If the branch record's location field reads “Springfield”:
  Output the owner field of the account record.

- Programmer controls “navigation”: accounts → branches
  - How about branches → accounts?

What’s wrong?

- The best navigation strategy & the best way of organizing the data depend on data/workload characteristics

With the CODASYL approach

- To write correct code, programmers need to know how data is organized physically (e.g., which indexes exist)
- To write efficient code, programmers also need to worry about data/workload characteristics
  - Can't cope with changes in data/workload characteristics
The relational revolution (1970’s)

- A simple model: data is stored in relations (tables)
- A declarative query language: SQL

```sql
SELECT Account.owner
FROM Account, Branch
WHERE Account.balance = 0
AND Branch.location = 'Springfield'
AND Account.branch_id = Branch.branch_id;
```
- Programmer specifies what answers a query should return, but not how the query is executed
- DBMS picks the best execution strategy based on availability of indexes, data/workload characteristics, etc.

Provides physical data independence

Physical data independence

- Applications should not need to worry about how data is physically structured and stored
- Applications should work with a logical data model and declarative query language
- Leave the implementation details and optimization to DBMS
- The single most important reason behind the success of DBMS today
  - And a Turing Award for E. F. Codd in 1981

Standard DBMS features

- Persistent storage of data
- Logical data model; declarative queries and updates → physical data independence
  - Relational model is the dominating technology today
  - What else?
DBMS is multi-user

• Example
  get account balance from database;
  if balance > amount of withdrawal then
    balance = balance - amount of withdrawal;
    dispense cash;
    store new balance into database;
• Homer at ATM1 withdraws $100
• Marge at ATM2 withdraws $50
• Initial balance = $400, final balance = ?
  • Should be $350 no matter who goes first

Final balance = $300

Homer withdraws $100:  Marge withdraws $50:
  read balance; $400
  if balance > amount then
  balance = balance - amount; $300
  write balance; $300

Final balance = $350

Homer withdraws $100:  Marge withdraws $50:
  read balance; $400
  if balance > amount then
  balance = balance - amount; $300
  write balance; $300
  read balance; $400
  if balance > amount then
  balance = balance - amount; $350
  write balance; $350
Concurrency control in DBMS

- Similar to concurrent programming problems?
  - But data not main-memory variables
- Similar to file system concurrent access?
  - Lock the whole table before access
    - Approach taken by MySQL in the old days
    - Still used by SQLite (as of Version 3)
  - But want to control at much finer granularity
    - Or else one withdrawal would lock up all accounts!

Recovery in DBMS

- Example: balance transfer
  - decrement the balance of account X by $100;
  - increment the balance of account Y by $100;
- Scenario 1: Power goes out after the first instruction
- Scenario 2: DBMS buffers and updates data in memory (for efficiency); before they are written back to disk, power goes out
- How can DBMS deal with these failures?

Standard DBMS features: summary

- Persistent storage of data
- Logical data model; declarative queries and updates \(\rightarrow\) physical data independence
- Multi-user concurrent access
- Safety from system failures
- Performance, performance, performance
  - Massive amounts of data (terabytes–petabytes)
  - High throughput (thousands–millions transactions/hour)
  - High availability (\(\geq 99.999\%\) uptime)
**DBMS architecture today**

- Applications
- Queries/modify, DBMS, interface
- Answers/responses
- OS, system interface
- DMR(s), storage system interface

- Much of the OS may be bypassed for performance and safety
- We will be filling in many details of the DBMS box throughout the semester

---

**AYBABTU?**

- “Us” = relational databases
- Most data are not in them!
  - Personal data, web, scientific data, system data, ...
  - Text and semi-structured data management
    - XML, JSON, ...
- “NoSQL” and “NewSQL” movement
  - MongoDB, Cassandra, BigTable, HBase, Spanner, HANA...
- This course will look beyond relational databases

---

**Course components**

- Relational databases
  - Relational algebra, database design, SQL, app programming
- XML
  - Data model and query languages, app programming, interplay between XML and relational databases
- Database internals
  - Storage, indexing, query processing and optimization, concurrency control and recovery
- Advanced topics (TBD)
  - Data warehousing and data mining, Web search and indexing, parallel data processing/MapReduce, etc.
Announcements (Tue. Aug. 25)

• Permission numbers will be emailed this Thursday evening based on the wait list
  • Contact me if you cannot get onto the wait list for some reason (e.g., prerequisites)
• Amazon AWS credit codes will be emailed based on the enrollment list by next Monday
• This Thursday: our first language of the semester—relational algebra!
