

Relational Database Design Theory

Introduction to Databases
CompSci 316 Fall 2015

Announcements (Tue. Sep. 8)

- Homework #1 due next Tuesday (11:59pm)
- Course project description posted
 - Milestone #1 right after fall break
 - Teamwork required: 4 people per team

Motivation

<i>uid</i>	<i>uname</i>	<i>gid</i>
142	Bart	dps
123	Milhouse	gov
857	Lisa	abc
857	Lisa	gov
456	Ralph	abc
456	Ralph	gov
...

- Why is *UserGroup* (*uid*, *uname*, *gid*) a bad design?
 -
- Wouldn't it be nice to have a systematic approach to detecting and removing redundancy in designs?
 - Dependencies, decompositions, and normal forms

Functional dependencies

- A **functional dependency (FD)** has the form $X \rightarrow Y$, where X and Y are sets of attributes in a relation R
- $X \rightarrow Y$ means that whenever two tuples in R agree on all the attributes in X , they must also agree on all attributes in Y

X	Y	Z
a	b	c
a	b	?

Must be b → ... → Could be anything

FD examples

Address (street_address, city, state, zip)

- street_address, city, state \rightarrow zip
-
-
- **Trivial FD:** LHS \supseteq RHS
- **Completely non-trivial FD:** LHS \cap RHS = \emptyset

Redefining “keys” using FD’s

A set of attributes K is a **key** for a relation R if

- $K \rightarrow$ all (other) attributes of R
 - That is, K is a “**super key**”
- No proper subset of K satisfies the above condition
 - That is, K is **minimal**

Reasoning with FD's

Given a relation R and a set of FD's \mathcal{F}

- Does another FD follow from \mathcal{F} ?
 - Are some of the FD's in \mathcal{F} redundant (i.e., they follow from the others)?
- Is K a key of R ?
 - What are all the keys of R ?

Attribute closure

- Given R , a set of FD's \mathcal{F} that hold in R , and a set of attributes Z in R :
The **closure of Z** (denoted Z^+) with respect to \mathcal{F} is the set of all attributes $\{A_1, A_2, \dots\}$ functionally determined by Z (that is, $Z \rightarrow A_1 A_2 \dots$)
- Algorithm for computing the closure
 - Start with closure = Z
 - If $X \rightarrow Y$ is in \mathcal{F} and X is already in the closure, then also add Y to the closure
 - Repeat until no new attributes can be added

A more complex example

UserJoinsGroup (*uid*, *uname*, *twitterid*, *gid*, *fromDate*)

Assume that there is a 1-1 correspondence between our users and Twitter accounts

- $uid \rightarrow uname, twitterid$
- $twitterid \rightarrow uid$
- $uid, gid \rightarrow fromDate$

Not a good design, and we will see why shortly

10

Example of computing closure

- $\{gid, twitterid\}^+ = ?$
- $twitterid \rightarrow uid$
 - Add uid
 - Closure grows to $\{gid, twitterid, uid\}$
- $uid \rightarrow uname, twitterid$
 - Add $uname, twitterid$
 - Closure grows to $\{gid, twitterid, uid, uname\}$
-

\mathcal{F} includes:

- $uid \rightarrow uname, twitterid$
- $twitterid \rightarrow uid$
- $uid, gid \rightarrow fromDate$

11

Using attribute closure

Given a relation R and set of FD's \mathcal{F}

- Does another FD $X \rightarrow Y$ follow from \mathcal{F} ?
 - Compute X^+ with respect to \mathcal{F}
 - If $Y \subseteq X^+$, then $X \rightarrow Y$ follows from \mathcal{F}
- Is K a key of R ?
 - Compute K^+ with respect to \mathcal{F}
 - If K^+ contains all the attributes of R , K is a super key
 - Still need to verify that K is *minimal* (how?)

12

Rules of FD's

- Armstrong's axioms
 - Reflexivity: If $Y \subseteq X$, then $X \rightarrow Y$
 - Augmentation: If $X \rightarrow Y$, then $XZ \rightarrow YZ$ for any Z
 - Transitivity: If $X \rightarrow Y$ and $Y \rightarrow Z$, then $X \rightarrow Z$
- Rules derived from axioms
 - Splitting: If $X \rightarrow YZ$, then $X \rightarrow Y$ and $X \rightarrow Z$
 - Combining: If $X \rightarrow Y$ and $X \rightarrow Z$, then $X \rightarrow YZ$

☞ Using these rules, you can prove or disprove an FD given a set of FDs

Non-key FD's

- Consider a non-trivial FD $X \rightarrow Y$ where X is **not** a super key
 - Since X is not a super key, there are some attributes (say Z) that are not functionally determined by X

X	Y	Z
a	b	c_1
a	b	c_2
...

That b is associated with a is recorded multiple times:
 redundancy, update/insertion/deletion anomaly

Example of redundancy

UserJoinsGroup (uid , $uname$, $twitterid$, gid , $fromDate$)

- $uid \rightarrow uname, twitterid$
- (... plus other FD's)

uid	uname	twitterid	gid	fromDate
142	Bart	@BartJSimpson	dps	1987-04-19
123	Milhouse	@MilhouseVanD	gov	1989-12-17
857	Lisa	@LisaSimpson	abc	1987-04-19
857	Lisa	@LisaSimpson	gov	1988-09-01
456	Ralph	@RalphWiggum	abc	1991-04-25
456	Ralph	@RalphWiggum	gov	1992-09-01
...

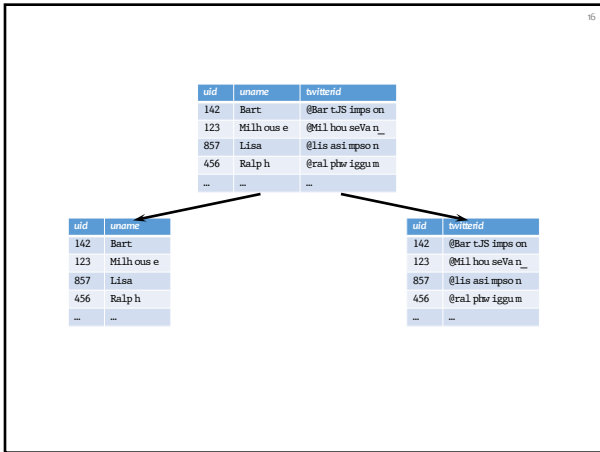

Decomposition

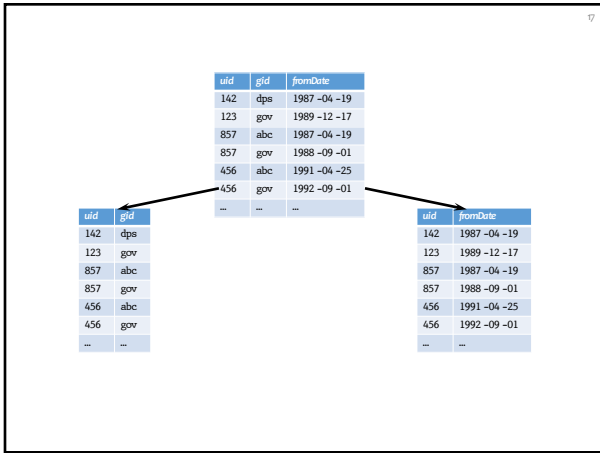

uid	uname	twitterid	gid	fromDate
142	Bart	@BartJSimpson	dps	1987-04-19
123	Milhouse	@MilhouseVanD	gov	1989-12-17
857	Lisa	@LisaSimpson	abc	1987-04-19
857	Lisa	@LisaSimpson	gov	1988-09-01
456	Ralph	@RalphWiggum	abc	1991-04-25
456	Ralph	@RalphWiggum	gov	1992-09-01
...

uid	uname	twitterid
142	Bart	@BartJSimpson
123	Milhouse	@MilhouseVanD
857	Lisa	@LisaSimpson
456	Ralph	@RalphWiggum
...

uid	gid	fromDate
142	dps	1987-04-19
123	gov	1989-12-17
857	abc	1987-04-19
857	gov	1988-09-01
456	abc	1991-04-25
456	gov	1992-09-01
...

- Eliminates redundancy
- To get back to the original relation:

18

Lossless join decomposition

- Decompose relation R into relations S and T
 - $attrs(R) = attrs(S) \cup attrs(T)$
 - $S = \pi_{attrs(S)}(R)$
 - $T = \pi_{attrs(T)}(R)$
- The decomposition is a **lossless join decomposition** if, given known constraints such as FD's, we can guarantee that $R = S \bowtie T$
- Any decomposition gives $R \subseteq S \bowtie T$ (why?)
 - A **lossy** decomposition is one with $R \subset S \bowtie T$

Loss? But I got more rows!

- “Loss” refers not to the loss of tuples, but to the loss of information
 - Or, the ability to distinguish different original relations

uid	gid	fromDate
142	dps	1987-04-19
123	gov	1989-12-17
857	abc	1988-09-01
857	gov	1987-04-19
456	abc	1991-04-25
456	gov	1992-09-01
...

No way to tell
which is the original relation

uid	gid
142	dps
123	gov
857	abc
857	gov
456	abc
456	gov
...	...

uid	fromDate
142	1987-04-19
123	1989-12-17
857	1987-04-19
857	1988-09-01
456	1991-04-25
456	1992-09-01
...	...

Questions about decomposition

- When to decompose
- How to come up with a correct decomposition (i.e., lossless join decomposition)

An answer: BCNF

- A relation R is in Boyce-Codd Normal Form if
 - For every non-trivial FD $X \rightarrow Y$ in R , X is a super key
 - That is, all FDs follow from “key \rightarrow other attributes”
- When to decompose
 - As long as some relation is not in BCNF
- How to come up with a correct decomposition
 - Always decompose on a BCNF violation (details next)
 - ☞ Then it is guaranteed to be a lossless join decomposition!

22

BCNF decomposition algorithm

- Find a **BCNF violation**
 - That is, a non-trivial FD $X \rightarrow Y$ in R where X is **not** a super key of R
- Decompose R into R_1 and R_2 , where
 - R_1 has attributes $X \cup Y$
 - R_2 has attributes $X \cup Z$, where Z contains all attributes of R that are in neither X nor Y
- Repeat until all relations are in BCNF

23

BCNF decomposition example

$uid \rightarrow uname, twitterid$
 $twitterid \rightarrow uid$
 $uid, gid \rightarrow fromDate$

UserJoinsGroup (*uid, uname, twitterid, gid, fromDate*)
 BCNF violation: $uid \rightarrow uname, twitterid$

```

  graph TD
    A["UserJoinsGroup (uid, uname, twitterid, gid, fromDate)"] --> B["User (uid, uname, twitterid)"]
    A --> C["Member (uid, gid, fromDate)"]
  
```

24

Another example

$uid \rightarrow uname, twitterid$
 $twitterid \rightarrow uid$
 $uid, gid \rightarrow fromDate$

UserJoinsGroup (*uid, uname, twitterid, gid, fromDate*)
 BCNF violation: $twitterid \rightarrow uid$

```

  graph TD
    A["UserJoinsGroup (uid, uname, twitterid, gid, fromDate)"] --> B["User (uid, uname, twitterid)"]
    A --> C["Member (uid, gid, fromDate)"]
  
```

Why is BCNF decomposition lossless

Given non-trivial $X \rightarrow Y$ in R where X is **not** a super key of R , need to prove:

- Anything we project always comes back in the join:

$$R \subseteq \pi_{XY}(R) \bowtie \pi_{XZ}(R)$$
 - Sure; and it doesn't depend on the FD
- Anything that comes back in the join must be in the original relation:

$$R \supseteq \pi_{XY}(R) \bowtie \pi_{XZ}(R)$$
 - Proof will make use of the fact that $X \rightarrow Y$

Recap

- Functional dependencies: a generalization of the key concept
- Non-key functional dependencies: a source of redundancy
- BCNF decomposition: a method for removing redundancies
 - BCNF decomposition is a lossless join decomposition
- BCNF: schema in this normal form has no redundancy due to FD's

BCNF = no redundancy?

- User (*uid, gid, place*)
 - A user can belong to multiple groups
 - A user can register places she's visited
 - Groups and places have nothing to do with other
 - FD's?

uid	gid	place
142	dps	Springfield
142	dps	Australia
456	abc	Springfield
456	abc	Morocco
456	gov	Springfield
456	gov	Morocco
...

- BNCF?
- Redundancies?

Multivalued dependencies

- A **multivalued dependency (MVD)** has the form $X \twoheadrightarrow Y$, where X and Y are sets of attributes in a relation R
- $X \twoheadrightarrow Y$ means that whenever two rows in R agree on all the attributes of X , then we can swap their Y components and get two rows that are also in R

X	Y	Z
a	b ₁	c ₁
a	b ₂	c ₂
a	b ₂	c ₁
a	b ₁	c ₂
...

MVD examples

User (uid, gid, place)

- uid \twoheadrightarrow gid
-
-
- Trivial: LHS \cup RHS = all attributes of R
- Trivial: LHS \supseteq RHS

Complete MVD + FD rules

- FD reflexivity, augmentation, and transitivity
- MVD complementation:
If $X \twoheadrightarrow Y$, then $X \twoheadrightarrow attrs(R) - X - Y$
- MVD augmentation:
If $X \twoheadrightarrow Y$ and $V \subseteq W$, then $XW \twoheadrightarrow YV$
- MVD transitivity:
If $X \twoheadrightarrow Y$ and $Y \twoheadrightarrow Z$, then $X \twoheadrightarrow Z - Y$
- Replication (FD is MVD):
If $X \rightarrow Y$, then $X \twoheadrightarrow Y$ *Try proving things using these!?*
- Coalescence:
If $X \twoheadrightarrow Y$ and $Z \subseteq Y$ and there is some W disjoint from Y such that $W \rightarrow Z$, then $X \rightarrow Z$

31

An elegant solution: chase

- Given a set of FD's and MVD's \mathcal{D} , does another dependency d (FD or MVD) follow from \mathcal{D} ?
- Procedure
 - Start with the premise of d , and treat them as "seed" tuples in a relation
 - Apply the given dependencies in \mathcal{D} repeatedly
 - If we apply an FD, we infer equality of two symbols
 - If we apply an MVD, we infer more tuples
 - If we infer the conclusion of d , we have a **proof**
 - Otherwise, if nothing more can be inferred, we have a **counterexample**

32

Proof by chase

- In $R(A, B, C, D)$, does $A \twoheadrightarrow B$ and $B \twoheadrightarrow C$ imply that $A \twoheadrightarrow C$?

Have:

A	B	C	D
a	b ₁	c ₁	d ₁
a	b ₂	c ₂	d ₂

Need:

A	B	C	D
a	b ₁	c ₂	d ₁
a	b ₂	c ₁	d ₂

$A \twoheadrightarrow B$

A	B	C	D
a	b ₂	c ₁	d ₁
a	b ₁	c ₂	d ₂

$B \twoheadrightarrow C$

A	B	C	D
a	b ₂	c ₁	d ₂
a	b ₁	c ₂	d ₁

$B \twoheadrightarrow C$

A	B	C	D
a	b ₁	c ₂	d ₁
a	b ₁	c ₁	d ₂

33

Another proof by chase

- In $R(A, B, C, D)$, does $A \rightarrow B$ and $B \rightarrow C$ imply that $A \rightarrow C$?

Have:

A	B	C	D
a	b ₁	c ₁	d ₁
a	b ₂	c ₂	d ₂

Need: $c_1 = c_2$

$A \rightarrow B$ $b_1 = b_2$

$B \rightarrow C$ $c_1 = c_2$

In general, with both MVD's and FD's, chase can generate both new tuples and new equalities

34

Counterexample by chase

- In $R(A, B, C, D)$, does $A \twoheadrightarrow BC$ and $CD \rightarrow B$ imply that $A \rightarrow B$?

Have:	A	B	C	D	Need:	$b_1 = b_2$
	a	b ₁	c ₁	d ₁		
	a	b ₂	c ₂	d ₂		
$A \twoheadrightarrow BC$	a	b ₂	c ₂	d ₁		
	a	b ₁	c ₁	d ₂		

Counterexample!

35

4NF

- A relation R is in **Fourth Normal Form (4NF)** if
 - For every non-trivial MVD $X \twoheadrightarrow Y$ in R , X is a superkey
 - That is, all FD's and MVD's follow from "key \rightarrow other attributes" (i.e., no MVD's and no FD's besides key functional dependencies)
- 4NF is stronger than BCNF
 - Because every FD is also a MVD

36

4NF decomposition algorithm

- Find a **4NF violation**
 - A non-trivial MVD $X \twoheadrightarrow Y$ in R where X is **not** a superkey
- Decompose R into R_1 and R_2 , where
 - R_1 has attributes $X \cup Y$
 - R_2 has attributes $X \cup Z$ (where Z contains R attributes not in X or Y)
- Repeat until all relations are in 4NF

- Almost identical to BCNF decomposition algorithm
- Any decomposition on a 4NF violation is lossless

4NF decomposition example 37

User (uid, gid, place)
 4NF violation: uid → gid

uid	gid	place
142	dps	Springfield
142	dps	Australia
456	abc	Springfield
456	abc	Morocco
456	gov	Springfield
456	gov	Morocco
...

Member (uid, gid) Visited (uid, place)

4NF 4NF

uid	gid
142	dps
456	abc
456	gov
...	...

uid	place
142	Springfield
142	Australia
456	Springfield
456	Morocco
...	...

Summary 38

- Philosophy behind BCNF, 4NF:
 - Data should depend on the key, the whole key, and nothing but the key!
 - You could have multiple keys though
- Other normal forms
 - 3NF: More relaxed than BCNF; will not remove redundancy if doing so makes FDs harder to enforce
 - 2NF: Slightly more relaxed than 3NF
 - 1NF: All column values must be atomic
