Announcements

• RQ 17 tomorrow 10am, RQ18 Tuesday, last 2!
• Assignment 8 due April 20
  – Exam 2 back next week
  – Coming… Points dropped on RQ, Lecture and Lab

• Today:
  – Recommender
  – How do you access directories
  – Recursion – Solving problems by solving smaller and smaller similar problems
Math, Engineering, Sociology

- Netflix prize in 2009
  - Beat the system, win
  - http://nyti.ms/sPvR
Assignment 8: Collaborative Filtering

• How does Amazon know what I want?
  – Lots of customers, lots of purchases

• How does Pandora know music like Kanye's?
  – This isn't really collaborative filtering, more content-based

• How does Netflix recommend movies?
  – Why did they offer one million $$$ to better their method?

• Students at Duke who like Compsci also like …
  – Could this system be built?
From User Rating to Recommendations

[ ( 'Kim Lee', [1, 0, 3, -3, -1, 5, 1, 0] ), ( 'Charlotte', [3, 3, 5, 0, 0, 1, -3, -1] ), ( 'Jack Jack', [-1, 1, 0, 3, 1, -3, 5, 3] ), ( 'Java', [3, 3, 5, 3, 1, 3, 0, 1] ), ( 'Python', [1, 3, 5, 0, 3, 3, 3, 0] ), ( 'Xiaobai', [0, 5, 5, -5, 1, 0, -1, -3] ), ( 'Jo Jo', [0, 0, 0, 1, 1, 3, -1, 1] ) ]
Data For Recommender

• Users/Raters rate Items
  – We need to know the items
  – We need to know how users rate each item

• Which eatery has highest average rating?
  – Conceptually: average columns in table
  – How is data provided in this assignment?

<table>
<thead>
<tr>
<th></th>
<th>ABP</th>
<th>BlueEx</th>

<td>-1</td>
<td></td>
</tr>
</tbody>
</table>
Data For Recommender

• itemlist are provided in a list of strings
  – Parsing data provides this list
• dictratings provided in dictionary
  – Key is user ID
  – Value is list of integer ratings

<table>
<thead>
<tr>
<th></th>
<th>ABP</th>
<th>BlueEx</th>
<th>McDon</th>
<th>Loop</th>

</tbody>
</table>
Data For Recommender

• Given Parameters
  – itemlist: a list of strings
  – dictratings: dictionary of ID to ratings list

• Can you write
  – Average(itemlist, dictratings)
Drawbacks of Item Averaging

• Are all ratings the same to me?
  – Shouldn't I value ratings of people "near" me as more meaningful than those "far" from me?

• Collaborative Filtering
  – How do we determine who is "near" me?

• Mathematically: treat ratings as vectors in an N-dimensional space, \( N = \# \text{ ratings} \)
  – Informally: assign numbers, higher the number, closer to me
Collaborative Filtering: Recommender

• First determine closeness of all users to me:
  – "Me" is a user-ID, parameter to function
  – Return list of (ID, closeness-#) tuples, sorted

• Use just the ratings of person closest to me
  – Is this a good idea?
  – What about the 10 closest people to me?

• What about weighting ratings
  – Closer to me, more weight given to rating
How do you calculate a similarity?

• Me: [3, 5, -3]
• Joe: [5, 1, -1]
• Sue: [-1, 1, 3]

• Joe to Me

• Sue to Me
How do you calculate a similarity?

- Me: [3, 5, -3]
- Joe: [5, 1, -1]
- Sue: [-1, 1, 3]

- Joe to Me
  \[ (3*5 + 5*1 + -3 * -1) = 23 \]

- Sue to Me
  \[ (3*-1 + 5 * 1 + -3 * 3) = -7 \]
Collaborative Filtering

• For Chris: $12 * [1, 1, 0, 3, 0, -3] = - [12, 12, 0, 36, 0, -36]$

• For Sam: $[0, 75, 125, 0, -75, 125]$

<table>
<thead>
<tr>
<th></th>
<th>ABP</th>
<th>BlueEx</th>
<th>McDon</th>
<th>Loop</th>
<th>Panda</th>
<th>Nasher</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sam</td>
<td>0</td>
<td>3</td>
<td>5</td>
<td>0</td>
<td>-3</td>
<td>5</td>
</tr>
<tr>
<td>Chris</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>3</td>
<td>0</td>
<td>-3</td>
</tr>
<tr>
<td>Nat</td>
<td>-3</td>
<td>3</td>
<td>3</td>
<td>5</td>
<td>1</td>
<td>-1</td>
</tr>
</tbody>
</table>
Adding lists of numbers

\[
\begin{align*}
[12, & 12, 0, 36, 0, -36] \\
[0, & 75, 125, 0, -75, 125] \\
[-111, & 111, 111, 185, 37, -37] \\
& \vdots \\
[-99, & 198, 236, 221, -38, 52]
\end{align*}
\]

• Adding columns in lists of numbers

– Using indexes 0, 1, 2, … sum elements of list

– \( \text{sum}([\text{val}[i] \text{ for } \text{val} \text{ in } \text{d.values()}]) \)
Then divide by number of nonzeros

\[
\begin{bmatrix}
12, & 12, & 0, & 36, & 0, & -36 \\
0, & 75, & 125, & 0, & -75, & 125 \\
-111, & 111, & 111, & 185, & 37, & -37 \\
\end{bmatrix}
\]

---------------------------

\[
\begin{bmatrix}
-99, & 198, & 236, & 221, & -38, & 52 \\
\end{bmatrix}
\]

/2   /3   /2   /2   /2   /3

\[
\begin{bmatrix}
-49, & 66, & 118, & 110 & -19, & 17 \\
\end{bmatrix}
\]

Recommend 3rd item
Follow 12-step process

• ReadAllFood first!
  – Read input and save it
  – Get list of restaurants – use that ordering! Set?
  – For each person
    • For each restaurant and its rating
      – Must find location of restaurant in itemlist
      – Then update appropriate counter
  – Print any structure you create to check it
Plan for Today

• Recursion
  – Solving problems by solving similar but smaller problems

• Programming and understanding …
  – Hierarchical structures and concepts
    • What is a file system on a computer?
    • What is the Internet?
    • How does the Domain Name System Work?

• How do you access directories?
  • And all the files in a directory, and the …
Recursion
Solving a problem by solving similar but smaller problems
Recursion

Solving a problem by solving similar but smaller problems

**Question** - How many rows are there in this classroom?

**Similar but smaller question** - How many rows are there until your row?

<table>
<thead>
<tr>
<th>S</th>
<th>S</th>
</tr>
</thead>
<tbody>
<tr>
<td>S</td>
<td>S</td>
</tr>
<tr>
<td>S</td>
<td>S</td>
</tr>
</tbody>
</table>

I don’t have anyone to ask. So I am in Row#1

Row count = 4+1 = 5

Return Value = 3+1 = 4

Return Value = 2+1 = 3

Return Value = 1+1 = 2

Return value = 1

What's in a file-system Folder?
What's in a folder on your computer?

• Where are the large files?
• How do you find them?
• They take up space!
  – What’s the plan –
    1. Erase?
    2. Backup?
Hierarchy in Folder Structure

Level 0  Level 1  Level 2  Level 3  Level 4

Folder 1  Folder 2  Folder 3  Folder 4  Folder 5  Folder 6

compsci101 spring17

Base Case

compsci101 spring17 25
Recursion to find ALL files in a folder

- A folder can have sub folders and files
- A file cannot have sub files

```python
def visit(dirname):
    for inner in dirname:
        if isdir(inner):
            visit(inner)
        else:
            print(name(inner), size(inner))
```

Is that a directory?
If not a directory, it will be a file
def bigfiles(dirname, min_size):
    large = []
    for sub in os.listdir(dirname):
        path = os.path.join(dirname, sub)
        if os.path.isdir(path):
            subs = bigfiles(path, min_size)
            large.extend(subs)
        else:
            size = os.path.getsize(path)
            if size > min_size:
                large.append((path, size))
    return large

# on Mac like this:
bigs = bigfiles("/Users/Susan/Documents", 10000)
# on Windows like this:
bigs = bigfiles("C:\\Users\\Susan\\Documents", 10000)
Example Run

- ('C:\Users\Susan\files\courses\cps101\workspace\spring2015\assign4_transform\data\romeo.txt', 153088L)
- ('C:\Users\Susan\files\courses\cps101\workspace\spring2015\assign4_transform\data\twain.txt', 13421L)
- ('C:\Users\Susan\files\courses\cps101\workspace\spring2015\assign5_hangman\src\lowerwords.txt', 408679L)
- ...

compsci101 spring17
Finding Large Files questions
bit.ly/101s17-0413-2
The os and os.path libraries

- Libraries use an API to isolate system dependencies
  - C:\x\y
  - /Users/Susan/Desktop

- FAT-32, ReFS, WinFS, HFS, HSF+, fs
  - Underneath, these systems are different
  - Python API insulates and protects programmer

- Why do we have \texttt{os.path.join(x, y)}?
  - x = /Users/Susan/Documents
  - y = file1.txt
  - Output = /Users/Susan/Documents/file1.txt
Dissecting FileVisit.py

• How do we find the contents of a folder?
  – Another name for folder: directory

• How do we identify folder? (by name)
  – os.listdir(dirname) returns a list of files and folder

• Path is c:\user\ola\foo or /Users/ola/bar
  – os.path.join(dir,sub) returns full path
  – Platform independent paths

• What's the difference between file and folder?
  – os.path.isdir() and os.path.getsize()
Does the function call itself? No!

def visit(dirname):
    for inner in dirname:
        if isdir(inner):
            visit(inner)
        else:
            print name(inner), size(inner)

• Is a file inside itself? No!

• Does pseudo code make sense?
  – Details make this a little harder in Python, but close!
Structure matches Code

**Find large files**
If you see a folder,

1. Find the large files and subfolders
2. For the subfolders, repeat the process of finding large files and any other folders within that subfolder
3. Repeat the process until you reach the last folder

**Compress or Zip a folder**
If you see a folder,

1. Find the files and subfolders
2. For the subfolders, repeat the process of finding files and any other folders within that subfolder
3. At the last stage, start compressing files and move up the folder hierarchy
Structure matches Code

• Structure of list of lists
  – Can also lead to processing a list which requires processing a list which …

\[
\begin{bmatrix}
  \begin{bmatrix} a, b \end{bmatrix},
  \begin{bmatrix} c, d \end{bmatrix},
  \begin{bmatrix} a, \begin{bmatrix} b, c \end{bmatrix}, d \end{bmatrix}
\end{bmatrix}
\]

\[(a \times (b + c \times (d + e \times f))) + (a \times (b + d))\]
Recursion

- Simpler or smaller calls
- Must have a base case when no recursive call can be made
  - Example - The last folder in the folder hierarchy will not have any subfolders. It can only have files. That forms the base case
Sir Anthony (Tony) Hoare

There are two ways of constructing a software design. One way is to make it so simple that there are obviously no deficiencies. And the other way is to make it so complicated that there are no obvious deficiencies.

Turing Award, didn’t get recursion…..

Inventor of quicksort
def Mystery(num):
    if num > 0:
        return 1 + Mystery(num/2)
    else:
        return 2 + num
Something Recursion
bitly/101s17-0413-4

def Something(data):
    # data is a list of integers
    if len(data) == 0:
        return 0
    if data[0] % 2 == 0:  # it is even
        return data[0] + Something(data[1:])
    else:
        return Something(data[1:])
